

Do You Experience Painful Diabetic Neuropathy?

We are currently seeking volunteers with either Type 1 or Type 2 diabetes who experience moderate to severe pain from diabetic neuropathy. This is a study of a new investigational injectable medication that may help to slow down, stop or even reverse the progression of neuropathy.

Study Information

Eligible patients will be determined based on results from lab tests, pain questionnaires, and diagnostic procedures. Two out of every three of the participants will receive the study medication and one of every three will receive placebo. The medication will be given a total of 4 times: 2 times over a two week period, then 11 weeks later: 2 times over other two week period (Day 0, Day 14, Day 90, and Day 104). A doctor will administer the medication and it will require 16 intramuscular injections into each calf.

There will be approximately 11 visits over a 9 month period. The study will also cover up to 3 eye exams, cancer screening if applicable and participant compensation.
